

1. <b>If you're looking at a SLL or DLL with the head &amp; tail equaling the same node, what does that tell you?</b>	That the length of the list is 1.	7. <b>What are the names of the complexity classes?</b>	Constant, $O(1)$ Logarithmic $O(\log n)$ Linear $O(n)$ Loglinear $O(n \log n)$ Polynomial $O(n^2)$ Exponential $O(c^n)$ Factorial $O(n!)$
2. <b>Of the two swapping sorts, which is the most efficient when write speeds are limited?</b>	Selection sort, because Bubble will swap every value in each comparison, where Selection will only sort after each inner loop is completed.  Both are $O(n^2)$ time complexity & $O(1)$ space complexity.	8. <b>What are the two most easily confused complexity types?</b>	Polynomial, $O(n^2)$ , and exponential $O(2^n)$  Exponential is worse.
3. <b>Rank the following from least to most complex:</b> $O(n)$ $O(n!)$ $O(1)$ $O(n \log n)$ $O(c^n)$ $O(\log n)$ $O(n^2)$	1. $O(1)$ - constant 2. $O(\log n)$ - logarithmic 3. $O(n)$ - linear 4. $O(n \log n)$ - loglinear, linearithmic, quasilinear 5. $O(n^2)$ - polynomial 6. $O(c^n)$ - exponential 7. $O(n!)$ - factorial	<b>Which is worse?</b>	
4. <b>What are the costs of Merge Sort? Benefits?</b>	The major cost is space - it has $O(n)$ space complexity.  However, it has $O(n \log n)$ time complexity, so it's much faster than bubble, selection, or insertion sort	9. <b>What complexity does <math>O(3^n)</math> represent?</b>	Exponential
5. <b>What are the methods of a Queue? What do they do?</b>	Enqueue(Insertion): Adds a Node to the front of the Queue. Returns an Integer - New size of Queue Dequeue(Deletion): Removes a Node from the front of the Queue. Returns the Node removed from front of Queue. Size: Returns the current size of the Queue. Returns an Integer.	10. <b>What defines a doubly-linked list?</b>	Nodes have two pointers connecting them bi-directionally (`.previous` and `.next`).
6. <b>What are the methods of a Stack? What do they do?</b>	Push(Insertion): Adds a Node to the top of the Stack. Returns an Integer - New size of stack Pop(Deletion): Removes a Node from the top of the Stack. Returns the Node removed from top of Stack Size: Returns the current size of the Stack. Returns an Integer.	11. <b>What defines a singly-linked list?</b>	Nodes have a single pointer connecting them in a single direction (`.next`)
		12. <b>What is a Linked List?</b>	A Linked List data structure represents a linear sequence of "vertices" (or "nodes").
		13. <b>What is the Big-O of Binary Search?</b>	<b>*Time Complexity: <math>O(\log(n))</math>*</b> The number of recursive calls is the number of times we must halve the array until its length becomes 0. <b>*Space Complexity: <math>O(n)</math>*</b> Our implementation uses $n$ space due to half arrays we create using slice.
		14. <b>What is the Big-O of Bubble Sort?</b>	<b>*Time Complexity: <math>O(n^2)</math>*</b> The inner for loop contributes $O(n)$ in isolation. In the worst case scenario, the while loop will need to run $n$ times to bring all $n$ elements into their final resting positions. <b>*Space Complexity: <math>O(1)</math>*</b> Bubble sort uses the same amount of memory and create the same amount of variables regardless of the size of the input

15. <b>What is the Big-O of Insertion Sort?</b>	<p><b>*Time Complexity: <math>O(n^2)</math>*</b></p> <p>The outer loop <math>i</math> contributes <math>O(n)</math> in isolation. The inner while loop will contribute roughly <math>O(n / 2)</math> on average. The two loops are nested so our total time complexity is <math>O(n * n / 2) = O(n^2)</math>.</p> <p><b>*Space Complexity: <math>O(1)</math>*</b></p> <p>We use the same amount of memory and create the same amount of variables regardless of the size of our input.</p>	21. <b>What is the complexity of a function with a nested loop?</b>	Typically polynomial, $O(n^2)$ ?
16. <b>What is the Big-O of Merge Sort?</b>	<p><b>*Time Complexity: <math>O(n \log(n))</math>*</b></p> <p>Since we split the array in half each time, the number of recursive calls is <math>O(\log(n))</math>. The while loop within the merge function contributes <math>O(n)</math> in isolation and we call that for every recursive mergeSort call.</p> <p><b>*Space Complexity: <math>O(n)</math>*</b></p> <p>We will create a new subarray for each element in the original input.</p>	22. <b>What is the least complex Big O?</b>	Constant, $O(1)$ , followed closely by logarithmic, $O(\log n)$
17. <b>What is the Big-O of Quick Sort?</b>	<p><b>Avg Case: <math>O(n \log(n))</math></b></p> <p>The partition step alone is <math>O(n)</math>. We are lucky and always choose the median as the pivot. This will halve the array length at every step of the recursion <math>O(\log(n))</math>.</p> <p><b>Worst Case: <math>O(n^2)</math></b></p> <p>We are unlucky and always choose the min or max as the pivot. This means one partition will contain everything, and the other partition is empty <math>O(n)</math>.</p> <p><b>*Space Complexity: <math>O(n)</math>*</b></p> <p>Our implementation of quickSort uses <math>O(n)</math> space because of the partition arrays we create.</p>	23. <b>What sort type works through swapping, then ordering, the position of elements?</b>	Bubble sort
18. <b>What is the Big-O of Selection Sort?</b>	<p><b>*Time Complexity: <math>O(n^2)</math>*</b></p> <p>The outer loop <math>i</math> contributes <math>O(n)</math> in isolation. The inner loop <math>j</math> will contribute roughly <math>O(n / 2)</math> on average. The two loops are nested so our total time complexity is <math>O(n * n / 2) = O(n^2)</math>.</p> <p><b>*Space Complexity: <math>O(1)</math>*</b></p> <p>We use the same amount of memory and create the same amount of variables regardless of the size of our input.</p>	24. <b>What sort works by identifying the middle index, then splitting table, then repeating until there are arrays containing each value of the original array?</b>	Merge Sort
19. <b>What is the Big-O Simplify Products rule?</b>	if the function is a product of many terms, we drop the terms that don't depend on the size of the input $O(2n) \Rightarrow O(n)$	25. <b>What's the worst complexity? When would you use that?</b>	Factorial  Literally never! It's the worst, by far.
20. <b>What is the Big-O Simplify Sums rule?</b>	if the function is a sum of many terms, we keep the term with the largest growth rate and drop the other terms. $O(n^2 + n) \Rightarrow O(n^2)$	26. <b>What type of sort works through iterating through the unsorted region, finding the min, and swapping it with the first value?</b>	Selection sort
		27. <b>When building a constructor for a doubly linked list, what are its' properties?</b>	DLL Properties: this.head this.tail this.length  DLL Node Properties: this.value this.next this.previous
		28. <b>When building a constructor for a singly linked list, what are its' properties? What about the node constructor for a SLL</b>	SLL Properties: this.head this.tail this.length  SLL Node Properties: this.value this.next
		29. <b>When do we use Binary Search?</b>	The input data is sorted!

<p>30. <b>When working with stacks &amp; queue's, what is the Big-O space complexity of their insertion &amp; deletion? How do they achieve that?</b></p>	<p><math>O(n)</math></p> <p>In either a stack or a queue, there are no indices, so to find or access any value, you must traverse the entire stack/queue's nodes.</p> <p>Queue's have some advantage when ordered, because you have the option to start at the front or back &amp; traverse.</p>	<p>36. <b>Which sort works by splitting the array around &amp; mid point, comparing the value to the first value of the 'upper' array &amp; 'lower' array, then repeating?</b></p> <p>Binary Search</p>
<p>31. <b>When working with stacks &amp; queue's, what is the Big-O time complexity of their insertion &amp; deletion? How do they achieve that?</b></p>	<p><math>O(1)</math> time complexity.</p> <p>They both have a constant reference to the front or back, which allows them to make additions or deletions in a single action.</p>	
<p>32. <b>When would we use Quick Sort?</b></p>	<p>When we need an easy to write, relatively efficient, sort, and especially if we know our array is already sorted to some predictable degree.</p> <p>In the worst case, where we grab a number that happens to be the min or max value of the table, the time complexity <math>O(n^2)</math>, but best case is <math>O(n * \log(n))</math></p> <p>The worst case is exceedingly rare in actual practice.</p>	
<p>33. <b>Which data structure allows deleting data elements from front and inserting at back? What 'out' structure does it have?</b></p>	<p>Queue</p> <p>FIFO</p>	
<p>34. <b>Which data structure allows deleting &amp; inserting elements from the front? What 'out' structure does it have?</b></p>	<p>Stack</p> <p>LIFO</p>	
<p>35. <b>Which sort works by splitting the array around a pivot point &amp; filtering the two remaining arrays?</b></p>	<p>Quick Sort</p>
